

Authentication

- Verifying who the user is.
- Example: Logging into your Gmail using email & password.
- It checks if you are a real & registered user.

Authorization

- Decides what the authenticated user is allowed to do.
- Example: A normal Gmail user can't access Admin Panel.
- It checks your permissions after login.

JWT (JSON Web Token)

TechZeen

- A compact, URL-safe token used to securely transmit information between parties.
- Looks like: eyJhbGciOiJI.....
- Contains encoded info like user ID, email, roles, etc.

How JWT Authentication Works

TechZeen

- User sends email & password to login
- Server verifies credentials
- If valid → server generates a JWT token & sends it to the user
- User sends that token with every request (in headers)
- Server verifies the token to authenticate the user on each request
